DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 7/21/08 has been entered.

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 39-68 rejected under 35 U.S.C. 103(a) as being unpatentable over Chabanne (EP 0816550). Chabanne discloses a method of washing clothes wherein after supplying wash water, water vapor is generated by a heater and injected into a drum during a washing operation. Washing operations conventionally include tumbling the clothes. Chabanne shows injecting the steam at a location in the central vicinity of the tub (figure 1). Absent the showing of unexpected results, relocating the point of entry of the vapor is considered to be a modification within the skill of one practicing the art. Using predetermined fill levels and filling the water tub in stages is conventional in the art. It is a common method of ensuring proper water quantity and preventing overfill. There are a finite number of times when steam can be added to the wash tub:

Art Unit: 1792

before wash water is supplied, during the supplying of wash water, or after the supplying of wash water as well as before tumbling the clothes, during tumbling the clothes, or after tumbling the clothes. Figuring out the optimum time and duration for the addition of steam is considered to be within the skill of one practicing the art. Water flows to the heater while flowing out of the steam injection tube (figure 1). One skilled in the art is capable of figuring out the optimum temperature for washing through routine experimentation. Thus, Chabanne obviates the method of injecting steam into a tumble-action washing machine during the washing operation.
